SDRAM ⇔ DUT Handshake

First in two Addresses

Base address (row x 1024) + C * 8 get first 4 addresses

Add 0 — Add 1
ROW 0 — 0 X10 — ROW 0 - x18
ROW 1 — 0X 410 — ROW 1 - x418
ROW 2 — 0x 810 — row 2 - x818
ROW 3 — 0X C10 — row 3 - xC18

Col_window $2^7 \rightarrow 128$
row index $2^{10} \rightarrow 1024$

First Column is 0 — C = 0, Col_index = 0 — C = C + Col_index, 2nd Column — C = 0, Col_index = 1 — C = C + 1

row = row + row_index

Do for row, then reset C then 2nd row then reset C then 3rd row reset C then 4th row reset C and increment col_index by 1

Do this until Col_index = 127

then increment row a by 1
Row b
Row c
Row D
